

# RAPID INCIDENT ANALYSIS WITH REMOTE DATA COLLECTION

## Kivu's patented technology dramatically cuts response times

Effective incident response is all about speed. Losing valuable time to on-site travel can cost a business millions, which is why it's vital to have access to an incident response service that can be run remotely.

Kivu's patented proprietary technology tool scans IT systems remotely and securely to collect the forensic data required to investigate cyber attacks. KECT (Kivu Enterprise Collection Tool) was engineered to find Indicators of Compromise (IOC) fast, enabling Kivu's expert analysts to quickly identify and resolve cyber incidents.

Since its first deployment in 2016, KECT has been used in over 800 cases, often within 30 minutes of the engagement kick-off call, which saves crucial response time during a cyber attack.

### KECT is:

#### Straightforward

KECT is easy to implement, with a simple download and minimal technical expertise. Clients can run the software on their networks without the need for on-site support.

#### Secure

The scope of data collected is determined specifically for each deployment, and all collected data is encrypted before being sent to secure U.S. or EU-based servers, depending on the user's location.

#### Scalable

KECT is agentless and can efficiently run on everything from small networks to networks with as many as 100,000 endpoints. Once deployed, it automatically executes until all required data has been collected and can then self-delete.

KECT is trusted by insurance and law firms worldwide as a reliable tool to minimize and mitigate the effects of cyber incidents. The benefits are clear:

- **Lower incident response costs:** no on-site personnel required
- **Fast analysis:** even large corporate networks are scanned in less than 60 minutes
- **Low client impact:** no software installations or calibration required
